

Jurol James R. Cabaluna

Senior Java Developer

PROFILE SUMMARY

Jurol is a Senior Software Engineer with over a decade of experience in designing, developing, and delivering enterprise software solutions across Enterprise Resource Planning (ERP), Warehouse and Logistics, Integrated Element Management Systems (IEMS), and Internet of Things (IoT) domains.

He has extensive experience in building and enhancing Warehouse and Logistics systems, with a strong focus on microservices architecture, system integration, performance optimization, and scalable event-driven solutions. In his recent work, he has contributed to modernizing logistics platforms by transforming traditional ETL-based processing into an event-driven architecture using Azure Service Bus, enabling more responsive, scalable, and reliable data processing and system integration.

Beyond hands-on development, Jurol has taken on technical leadership responsibilities, leading projects and initiatives from implementation through delivery and contributing to their overall success. He serves as a key technical decision-maker within project teams, with technical direction and architectural decisions frequently relying on his experience and expertise. He works closely with stakeholders and fellow engineers to evaluate technical approaches, resolve complex challenges, and establish solutions that balance maintainability, scalability, performance, and business requirements.

Jurol has played a pivotal role in developing Integrated Element Management Systems (IEMS), contributing to the management, monitoring, and integration of complex systems with an emphasis on reliability and operational efficiency.

He also has hands-on experience in IoT systems and data visualization, developing solutions that collect, process, and visualize data from connected devices to provide meaningful insights and improve monitoring and decision-making.

Jurol excels in Database Management and Performance Optimization, with experience in designing data models, optimizing queries and application workflows, and improving system performance to support high-volume enterprise applications while maintaining data integrity and reliability.

He is committed to Software Process Improvement, continuously identifying opportunities to improve development practices, system architecture, code quality, and delivery processes. He also has hands-on experience in DevOps and CI/CD, applying modern development and deployment practices to improve automation, collaboration, and software delivery efficiency.

SKILLS

Programming Languages: Java, JavaScript, TypeScript

Frontend Technologies: React, Angular, HTML5, Material UI, CSS

Backend Technologies: Spring Boot, NodeJS, ExpressJS

Database: PostgreSQL, MySQL, MariaDB, MongoDB

Cloud Platforms: Microsoft Azure, Amazon Web Services (AWS)

DevOps & CI/CD: Docker, Kubernetes, Jenkins, Azure DevOps, GitLab Pipelines

Architecture & Integration: Microservices Architecture, Event-Driven Architecture, RESTful APIs, Identity Provider (IDP) Integration such as SSO and User Federation

Tools & Platforms: Git, GitHub, GitLab, Jira, Azure DevOps, Postman

Methodologies: Agile, Scrum, Kanban, Waterfall

Others: Software Engineering: Requirements Analysis, Project Planning, Design, Implementation, Testing, Maintenance, Software Architecture, Configuration Management, Database Optimization

EXPERIENCE

Senior Java Developer | July 2022 - Present
CoDev

- Projects:**
- AIMSPlus++ Application
 - Project Summary: Tellworks AIMSPlus+ App is a General Contractors tool for warehouse management solutions such as Forward Logistics, Reverse Logistics, SKU Library and Inventory management and more.
 - Client Industry: Warehouse and Logistics
 - Duration: July 2022 – Present
 - Role/Title: Senior Java Developer | Module In-Charge or Tech Lead Desginer
 - Overall Responsibilities:
 - Lead the design, development, and delivery of key application modules, providing technical direction and contributing to architectural and implementation decisions across the project.
 - Serve as a key technical decision-maker for assigned modules and initiatives, evaluating solution approaches and ensuring designs are scalable, maintainable, performant, and aligned with business requirements.
 - Design and develop web applications across backend, frontend, database, and integration layers using Java, Spring Boot, React, TypeScript, PostgreSQL, and related technologies.
 - Design and implement microservices and RESTful APIs to support warehouse, logistics, inventory, order management, and external system integration requirements.
 - Lead the modernization of system integrations by transitioning traditional ETL-based processing toward an event-driven architecture using Azure Service Bus queues, improving scalability, responsiveness, and reliability of data processing.

- Project Team Size: 7
- Tools & Technologies: Java Springboot, Hibernate | ReactJS | Typescript | Material-UI | Azure DevOps | Azure Service Bus | Azure Services | Docker | Postman | IntelliJ | Codex
- Hadean Supercomputing Ltd.
 - Project Summary: Hadean Web Portal 2.0 is an enterprise grade web application that manages users and licenses for software products of Hadean Supercomputing Ltd.
 - Client Industry: Augmented Reality Technologies, Spatial Virtualization with Clustered applications
 - Duration: July 2022 – April 2023
 - Role/Title: Senior Java Developer / Main Backend Developer
 - Overall Responsibilities:
 - Served as the primary backend developer responsible for designing and implementing backend services and RESTful APIs for the Hadean Web Portal 2.0.
 - <example>: Built and integrated secure, maintainable RESTful APIs for enterprise applications
 - <example>: Designed scalable database schemas and optimized data access
 - Project Team Size: 8
 - Tools & Technologies: Java | ReactJS | Typescript | AWS | Keycloak | Docker | Jenkins | Maven | JIRA | Postman | Swagger

Software Senior Engineer | Feb 2018 - July 2022

NEC Telecomm Software Philippines, Inc. (NSP)

Projects:

- Inspection and Monitoring System (laMS) with Multiple Solutions
 - Project Summary: Inspection and Monitoring System (laMS) is an enterprise monitoring platform designed to collect, process, visualize, and manage data from multiple solutions and connected IoT devices. The system provides real-time monitoring and data visualization capabilities, enabling users to track operational conditions, analyze device and sensor information, and support effective decision-making.
 - Client Name / Industry: NEC Communications System (**NCOS**)
 - Duration: March 2019 - July 2022
 - Role/Title: Project Leader
 - Overall Responsibilities:
 - Led an 8-member development team and coordinated project activities from requirements analysis and technical design through implementation, testing, and delivery, while providing technical guidance and ensuring alignment with project objectives.
 - Designed and developed full-stack web solutions for IoT monitoring, including the collection, processing, and visualization of data from connected devices and multiple integrated solutions using Java, JavaScript/TypeScript, Angular, ReactJS, and cloud-based services.
 - Drove technical design and software process improvements while collaborating with clients and cross-functional teams to resolve complex technical issues, improve application quality, and ensure successful project delivery.
 - Project Team Size: 8
 - Tools & Technologies: Java | mBaaS Cloud Functions | JavaScript | jQuery | AdminLTE | LeafletJS | Turf.js

- Material Management System (MMS)
 - Project Summary: <Insert Project Summary>
 - Client Name / Industry: Material Management System (MMS) is a smart factory solution designed to manage and monitor materials stored within an Okiba (a designated storage area in a Japanese manufacturing environment). The system tracks pallet movements between storage and production areas, providing visibility into material locations and movement history. It supports efficient material handling, inventory monitoring, and traceability across factory operations.
 - Duration: September 2017 – Feb 2019
 - Role/Title: Software Design Engineer
 - Overall Responsibilities:
 - Designed and developed application features for monitoring materials and pallet movements across Okiba storage and production areas, supporting material traceability and visibility within smart factory operations.
 - Developed frontend and backend components for material tracking, monitoring, and visualization, including location-based features for representing pallet locations and movements within factory facilities.
 - Participated in requirements analysis, software design, implementation, testing, troubleshooting, and code reviews while collaborating with the project team to deliver reliable and maintainable factory monitoring solutions.
 - Project Team Size: 6
 - Tools & Technologies: Java | mBaaS Cloud Functions | JavaScript | jQuery | AdminLTE | LeafletJS | Turf.js

Earlier Career

- Software Engineer | I-Resource Consulting, Inc. | **Sep 2017 - February 2018**
(Deployed at NEC Telecomm Software Philippines, Inc until absorbed)
- Junior Software Developer | Spingine Corporation | **January 2017 - Mar 2017**
- Software Engineer | Geckotech Solutions, Inc. | **January 2016 - December 2017**

EDUCATION

Bachelor of Science in Computer Engineering

Cebu Institute of Technology - University, Cebu City | **2010-2025**

CERTIFICATIONS

Linux Essentials | **2019**

Philippine National IT Standard - Fundamental Engineering | **2019**
